

Playing with Scales

In the inertial limit, and with $y \ll L$,

$$my'' + q\mathbf{E}_0 = 0 \quad \text{subject to} \quad y(0) = 0, \quad y'(0) = U_0$$

$$t_0 \sim \frac{mU_0}{qE_0}, \quad y_0 \sim \frac{mU_0^2}{qE_0}$$

$$\frac{y_0}{L} \sim \frac{mU_0^2}{qE_0L} \equiv \text{Eu}_e \equiv \frac{\text{inertia}}{\text{electrostatic force}}$$

Parameter Estimation

We find the parameters \mathbf{x} that solve the inverse problem $G(\mathbf{x}) = D$, using a direct search method (*Nelder-Mead*).

$$\min \chi^2 = \sum_{i=1}^n \frac{(yD(\mathbf{x})_i - yG(\mathbf{x})_i)^2}{yG(\mathbf{x})_i}$$

where $yG(\mathbf{x})$ is a solution of $my'' = \frac{1}{2}\rho C_D A_d^2 y'^2 + q\mathbf{E}(y) + \frac{1}{2}|E(y)|^2 \nabla \epsilon$

$$\mathbf{x} = \begin{cases} q \\ V_d \\ \sigma \end{cases} \quad \text{subject to } g = \begin{cases} V_d \pm u_{exp} \\ \sigma \pm u_{exp} \\ y_0 \pm u_{exp} \\ t_0 \pm u_{exp} \end{cases}$$
